

Current investment ecosystem

LabStart originates from the observation that the civil society does not choose the direction of innovations anymore. As an explanation, we underline two factors: common people feel less and less involved in the science and innovation process, and the actions of powerful conglomerates which are driven by their search for profit.

Our vision

The LabStart platform focuses on creating the best conditions for true global nondiscriminatory research investment growth. LabStart allows everyone to securely participate in financing research and development through the platform. Organizations submit their projects on the platform in order to raise funds, investors can then freely invest without having to go through third-party intermediaries.

A new way for innovation

Every investor, on a project funded through LabStart platform, holds a share of the future patent. Property is secured using smart contract technology and leads to a voting right, following the structure of decentralized organization. When a project has been completed, selling the patent is the opportunity for investors to maximize returns on their investments thanks to there being no intermediaries between them and the researchers. This ecosystem is made possible thanks to the blockchain and smart contracts, with a framework inspired from decentralized organizations.
